Piezoelectric IEPE Technology

ASC's Miniature Triaxial IEPE accelerometers are made of piezoelectric ceramics and are usable over a wide frequency range from 1Hz to 9kHz. The triaxial accelerometer is an IEPE (Integrated Electronics PiezoElectric) sensor that produces three simultaneous output voltages proportional to the input accelerations along X-, Y- and Z- axis. The sensor features three independent amplifiers that transform the high-impedance charge output from the piezoelectric ceramics (Lead Zirconate Titanate, PZT) into low-impedance voltage output that is suitable to drive long cables. ASC's miniature IEPE triaxial accelerometer operates on a 2-10mA constant-current supply and uses a four-wire cable for power input and signal output. The triaxial design incorporates three PZTs in annular shear mode where all three axes work independently, enabling single axial supply. This supply option provides the flexibility to power only one or two axes during uniaxial or biaxial measurements.

Description

ASC Type P203A12 is an analog voltage output sensor, which is designed for applications that demand compact triaxial sensors. The miniature size of this triaxial accelerometer enables simultaneous measurement of accelerations along three orthogonal axes of vibration on light-weight structures. The sensor is based on a piezoelectric annular shear design, which provides excellent immunity against base strain and temperature transients.

ASC Type P203A12 features a rugged titanium housing that is light-weight, corrosion proof and chemical resistant. ASC Type P203A12 operates over a wide temperature range from $-55^{\circ}C$ to $+125^{\circ}C$. The sensor incorporates a welded hermetic construction and can withstand shocks up to 5000g's. The industry standard 4-pin Microtech connector with side exit provides flexibility in mounting.

ASC Type P203A11 is the case-isolated version, with anodised aluminium alloy isolation cover. Both sensors feature built-in TEDS.
